

プロンプト集

2026 年 5 月 11 日

星野雄介（京都産業大学経営学部准教授）

本プロンプト集は、以下の論文のために作成された全プロンプトを掲載したものである。

対象論文：

星野雄介. (2026). 単一ケースから意思決定集合へーLLM を用いた反事実的ケース分析一. *武蔵野大学経営研究所紀要*, 14, (forthcoming).

内容：

- 1-1. 内部・外部環境抽出
- 1-2. 意思決定抽出
- 1-3. 結果抽出
- 1-4. 類似結果のグループ化
- 1-5. 結果の flip
- 1-6. 意思決定生成
- 1-7. 内容分析コードブック作成
- 1-8. 内容分析コーディング
- 1-9. LLM-as-a-judge

1-1 内部・外部環境抽出

"You are a qualitative researcher conducting structured case analysis for research on organizational decision-making.

Analyze the following case using the four-stage analytical structure:

(1) Context → (2) Interpretive Themes → (3) Decisions → (4) Outcomes

Your task is STRICTLY LIMITED to Stage (1): Context.

Do NOT describe interpretive themes, recognition, strategies, decisions, or outcomes.

Do NOT explain motivations or evaluate success.

Your goal is to extract ONLY relatively stable conditions that framed or constrained possible decisions.

Include as many items as necessary (typically 3–6).

Guidelines for labeling:

- Assign a short analytical label to each condition.
- The label should summarize the type of condition in a few words.
- Use lower_snake_case format (e.g., price_competition, industry_structure).
- Labels should represent structural conditions, not actions or strategies.
- Keep labels consistent in abstraction level across items.
- Avoid company-specific names unless necessary.
- Each label must correspond to exactly one sentence describing the condition.

Guidelines for sentence:

- Represent each condition as ONE short sentence (Subject + Verb).
- Each sentence must describe an environmental or organizational condition.
- Do NOT include company actions or reactions.
- Keep the abstraction level consistent.

Extract:

External context:

- Industry and business domain
- Competitive structure
- Market characteristics

- Regulatory / technological / demographic conditions (if relevant)

Internal context:

- Organizational structure or operational constraints
- Business model characteristics
- Leadership background as a structural condition
- Capabilities or limitations that framed feasible actions

Output format:

```
{
  "external": {
    "labelA": "Sentence describing external condition A.",
    "labelB": "Sentence describing external condition B."
  },
  "internal": {
    "labelC": "Sentence describing internal condition C.",
    "labelD": "Sentence describing internal condition D."
  }
}
```

1-2 意思決定抽出

"You are a qualitative researcher conducting structured case analysis for research on organizational decision-making.

Analyze cases using the four-stage framework:

(1) Context → (2) Interpretive Themes → (3) Decisions → (4) Outcomes

Your task is STRICTLY LIMITED to Stage (3): Decisions.

Rules:

- Extract ONLY observable managerial actions and decisions.
- Do NOT describe context, recognition, intentions, or outcomes.
- Do NOT explain why decisions were made.
- Do NOT evaluate effectiveness.
- Each decision must be ONE short sentence (Subject + Verb).
- Use concrete action verbs (e.g., introduced, changed, adopted, implemented).
- Avoid interpretation or inference.

Labeling rules:

- Assign a short analytical label to each decision.
- Use lower_snake_case (e.g., oil_change, fryer_upgrade).
- Labels must describe actions, not outcomes or intentions.
- Keep labels concise and consistent in abstraction level.
- Each label corresponds to exactly one sentence.

Include as many items as necessary (typically 3–6).

Output format:

```
{
  "3_decisions": {
    "labelA": "Sentence describing decision A.",
    "labelB": "Sentence describing decision B."
  }
}
```

1-3 結果抽出

"You are a qualitative researcher conducting structured case analysis for research on organizational decision-making.

Analyze the following case using the four-stage analytical structure:

(1) Context → (2) Interpretive Themes → (3) Decisions → (4) Outcomes

Your task is STRICTLY LIMITED to Stage (4): Outcomes.

Do NOT describe context, recognition, strategies, or decisions.

Do NOT explain causes or evaluate success.

Your goal is to extract ONLY observable results and separate them into direct and indirect outcomes.

Include as many items as necessary (typically 3–6).

Guidelines for labeling:

- Assign a short analytical label to each outcome.
- The label should summarize the type of outcome in a few words.
- Use lower_snake_case format (e.g., sales_growth, brand_improvement).
- Labels should represent outcomes, not causes, actions, or strategies.
- Keep labels consistent in abstraction level across items.
- Avoid company-specific names unless necessary.
- Each label must correspond to exactly one sentence describing the outcome.

Guidelines for sentence:

- Represent each outcome as ONE short sentence (Subject + Verb).
- Each sentence must describe an observable result.
- Do NOT include interpretations or reasons.
- Keep the abstraction level consistent.

Direct outcomes:

- Immediate, observable results (e.g., sales, costs, customer response, operational metrics)

Indirect outcomes:

- Mediated or longer-term consequences (e.g., organizational capability, learning, brand

perception)

Output format:

```
{
  "direct": {
    "labelA": "Sentence describing direct outcome A.",
    "labelB": "Sentence describing direct outcome B."
  },
  "indirect": {
    "labelC": "Sentence describing indirect outcome C.",
    "labelD": "Sentence describing indirect outcome D."
  }
}
```

1-4 類似結果のグループ化

"You are a qualitative researcher structuring outcome data for counterfactual analysis.

Your task is to group outcomes into coherent sets based on dependency and logical cohesion.

Instructions:

- Assign each outcome to a group based on conceptual or causal relatedness.
- Outcomes that would create contradictions if partially inverted **MUST** be placed in the same group.
- Use simple neutral group IDs (e.g., group_1, group_2, group_3).
- Do NOT try to create meaningful or descriptive group names.
- Each outcome must belong to **EXACTLY ONE** group.
- Do NOT modify, rewrite, or summarize the original sentences.
- Do NOT remove or add outcomes.
- Keep the number of groups small (typically 3–5).
- Focus on structural grouping, not semantic labeling.

Output format:

```
{
  "4_outcomes_grouped": {
    "direct": {
      "original_labelA": {
        "group": "group_1",
        "text": "Original sentence A."
      },
      "original_labelB": {
        "group": "group_1",
        "text": "Original sentence B."
      }
    },
    "indirect": {
      "original_labelC": {
        "group": "group_2",
        "text": "Original sentence C."
      }
    }
  }
}
```

```
},  
  ""original_labelD"": {  
    ""group"": ""group_3"",  
    ""text"": ""Original sentence D.""  
  }  
}  
}  
}"
```

1-5 結果の flip

"You are a qualitative researcher assisting with counterfactual case construction.

Your task is to generate, for each labeled outcome, a paired representation consisting of:

- (1) the original outcome and
- (2) its inverse outcome.

The input includes group assignments. Use them to maintain logical consistency.

Instructions:

- For each outcome, preserve the original label, group, and original sentence.
- Create a corresponding inverse label and inverse sentence.
- Reverse BOTH the meaning of the label and the sentence.
- Keep labels concise and parallel (e.g., sales_growth ↔ sales_decline).
- Use lower_snake_case for labels.
- Each sentence must be ONE short, observable outcome.
- Do NOT mention causes, intentions, strategies, or explanations.
- Do NOT add or remove items; preserve the structure (direct / indirect and number of items).
- Keep the abstraction level consistent between the original and inverse versions.

Consistency constraints:

- Outcomes within the same group must have logically consistent inverse directions.
- Avoid generating inverse outcomes that would contradict other outcomes in the same group.

Output format:

```
{
  "4_outcome_pairs": {
    "direct": {
      "original_labelA": {
        "group": "group_1",
        "positive_label": "original_labelA",
        "positive": "Original sentence for direct outcome A.",
        "negative_label": "inverse_labelA",
        "negative": "Inverse sentence for direct outcome A."
      }
    }
  }
}
```

```
},
  ""indirect"": {
    ""original_labelB"": {
      ""group"": ""group_2"",
      ""positive_label"": ""original_labelB"",
      ""positive"": ""Original sentence for indirect outcome B."",
      ""negative_label"": ""inverse_labelB"",
      ""negative"": ""Inverse sentence for indirect outcome B.""
    }
  }
}
```

1-6 意思決定生成

"You are a qualitative researcher conducting structured analysis of organizational decision-making based on case materials.

You will infer plausible managerial decisions under constrained conditions.

Framework:

Environment (fixed) → Decisions → Outcomes (given)

Your task:

Given a fixed environment and specified outcomes, generate managerial decisions that are consistent with BOTH.

Core constraints:

- Treat the environment as FIXED constraints. Do NOT modify, extend, or reinterpret them.
- Do NOT introduce new customer segments, markets, technologies, or external factors.
- Treat the outcomes as GIVEN conditions. Do NOT question or alter them.
- Do not introduce actions that are not explicitly grounded in the provided environment and outcomes.
- Assume the decision context is strictly limited to the time period of the case. Do NOT apply later trends or practices.
- Do NOT introduce new customer segments, menu categories, or store formats unless explicitly grounded in the provided environment.
- Do NOT translate managerial background or experience directly into new actions unless explicitly stated.

Decision requirements:

- Generate ONLY observable managerial actions taken by the firm.
- Each decision must be ONE short sentence (Subject + Verb).
- Use concrete, operational verbs (e.g., introduced, changed, implemented, replaced, installed).
- Decisions must be operational-level actions (process, product, equipment, or in-store practices).
- Favor incremental and concrete improvements over abstract or strategic initiatives.
- Avoid high-level strategic concepts (e.g., branding strategy, positioning, synergy, transformation).

Exclusions:

- Do NOT include intentions, goals, or interpretations.
- Do NOT explain causality.
- Do NOT describe outcomes.
- Do NOT introduce hypothetical or speculative initiatives.

Granularity control:

- Maintain a consistent level of detail similar to real case descriptions.
- Prefer specific, tangible changes (e.g., changing oil, modifying tools, adjusting procedures).
- Avoid large-scale or organization-wide strategic transformations unless explicitly present in the environment.

Scope control:

- Generate 5–8 decisions only.
- Ensure decisions form a coherent set within the same operational logic.

Diversity rule:

- Across multiple runs, produce structurally different decision sets.
- Within a single output, avoid redundant or overlapping actions.

Labeling:

- Assign a short analytical label to each decision.
- Use lower_snake_case (e.g., oil_change, fryer_upgrade, batter_storage_change).
- Labels must describe actions, not outcomes or intentions.

Output format:

```
{
  ""3_decisions"": {
    ""labelA"": ""Sentence describing decision A."",
    ""labelB"": ""Sentence describing decision B.""
  }
}
```

1-7 内容分析コードブック作成

"You are a qualitative researcher conducting content analysis of managerial decision-making.

Your task is to create an initial codebook for classifying managerial decisions.

The input contains 100 sampled managerial decisions selected from a larger set of generated counterfactual case decisions.

Your goal is to identify recurring decision types and construct a compact, analytically useful codebook.

Instructions:

- Read all sampled decisions before creating the codebook.
- Create codes that classify the type of managerial action.
- Codes should capture substantive differences in decisions, not superficial wording differences.
- Use 6–10 codes in total; Avoid creating separate codes for minor variants unless they represent analytically distinct decision types.

If two candidate codes overlap substantially, merge them and clarify distinctions within the definition.

- Use lower_snake_case for code names.
- Each code must include:
 1. code_name
 2. definition
 3. inclusion_criteria
 4. exclusion_criteria
 5. example_decisions from the input
- Avoid overly broad codes such as “strategy” or “improvement.”
- Avoid overly narrow codes that apply to only one decision unless analytically necessary.
- If two codes are conceptually close, clearly distinguish them.
- Do NOT evaluate whether the decisions are good or bad.
- Do NOT infer outcomes or intentions.
- Focus only on observable managerial actions.
- Output ONLY valid JSON.
- Do not include markdown, explanations, or comments.

After generating the initial codes, perform a final consolidation step:

- Merge redundant or highly overlapping codes
- Remove rarely applicable codes unless theoretically important
- Ensure each code is mutually exclusive and collectively covers the decision space

Output format:

```
{
  "decision_codebook": [
    {
      "code_name": "code_a",
      "definition": "Definition of the code.",
      "inclusion_criteria": "What kinds of decisions should be coded here.",
      "exclusion_criteria": "What should not be coded here.",
      "example_decisions": [
        "Example decision text 1.",
        "Example decision text 2."
      ]
    }
  ]
}
```

1-8 内容分析コーディング

"You are a qualitative researcher conducting content analysis of managerial decision-making.

Your task is to classify each managerial decision using the provided codebook.

Rules:

- Classify based on the primary observable action: what is changed, introduced, maintained, reduced, or standardized.
- Do NOT classify based primarily on intention, expected outcome, or strategic rationale.
- Use only codes provided in the codebook.
- Assign exactly one primary_code to each decision.
- Assign one secondary_code only if a second code is clearly relevant; otherwise use null.
- If a decision is ambiguous, choose the code that best captures the main action.
- Do NOT create new codes.
- Do NOT rewrite the decision text.
- Do NOT evaluate whether the decision is good or bad.

Coding priority rules:

- If a menu or recipe is changed, use the menu/recipe code even if a customer segment is mentioned.
- If equipment introduction or equipment-level settings are the main action, use the equipment/technology code.
- If manuals, procedures, rules, or standard operating processes are the main action, use the operations/process code.
- If the decision concerns store layout, interior, seating, lighting, cleanliness, or physical environment, use the store environment/layout code.
- If the decision concerns signage, menu display, language, photos, or point-of-sale communication, use the customer communication/signage code.
- If the decision concerns training or skill development, use the training code.
- If the decision concerns reporting, internal alignment, or parent-company communication, use the corporate reporting/internal alignment code.

Output ONLY valid JSON.

Do not include markdown, explanations, or comments.

Output format:

```
{
  "coded_decisions": [
    {
      "text": "Original decision text here.",
      "primary_code": "code_name",
      "secondary_code": null,
      "confidence": 0.0,
      "reason": "Brief reason for the coding decision."
    }
  ]
}
```

1-9 LLM-as-a-judge

"You are a qualitative research auditor evaluating and re-coding managerial decision classifications.

Your task is to:

- (1) independently re-code each decision using the FULL codebook (including definitions, inclusion, and exclusion criteria), and
- (2) evaluate whether the original assigned code is appropriate.

Instructions:

- Carefully read the full codebook.
- For each decision, assign a new code (re_code) based strictly on:
 - definition
 - inclusion criteria
 - exclusion criteria
- Then compare:
original_code vs re_code
- Classify the result into one of the following:
 - ""match"": both codes are substantively equivalent
 - ""minor_difference"": slightly different but conceptually close
 - ""mismatch"": clearly different coding
- Always prioritize:
 - the primary observable action (what is changed)
 - NOT intention, NOT outcome
- Do NOT create new codes.
- Use only codes from the codebook.

Additional evaluation:

- If the original coding violates exclusion criteria, mark as ""mismatch"".
- If both codes are plausible but emphasize different aspects, mark as ""minor_difference"".

Output ONLY valid JSON. No explanations outside JSON.

Output format:

```
{
  "audit_results": [
    {
      "decision_id": "D001",
      "text": "...",
      "original_code": "...",
      "re_code": "...",
      "judgment": "match | minor_difference | mismatch",
      "confidence": 0.0,
      "reason": "Brief explanation of why the codes match or differ."
    }
  ],
  "summary": {
    "total": 0,
    "match": 0,
    "minor_difference": 0,
    "mismatch": 0,
    "agreement_rate": 0.0
  }
}
```
